Abstract (en)
[origin: WO0015888A1] The invention relates to a device for feeding harness elements into a separating station of a draw-in machine, wherein harness elements such as a strand or a lamella can be individually separated from a stack in a separation station regardless of the size of the stack and regardless of the possible existence of a pressure element exerting pressure on said stack. To this end, the device comprises a feed rail on which the harness elements can be mounted and the harness elements are fitted with guide elements, e.g. guide holes serving to encompass at least one of the guide rails (31, 32, 131). The at least one guide rail (31, 32, 131) is inclined in relation to a horizontal line, whereby a gravitational force is exerted upon the harness elements.
