Abstract (en)

[origin: EP1114962A2] The lamp has a lamp head with a light source located in a hollow reflector, in which plug contacts project from the rear opening of the reflector. The light source is an LED (16). The body is a hollow reflector (16) which has a cylindrically shaped outer casing surface, which has up to the same diameter as the lamp head inner casing. That the lamp head inner casing has a ring shape, with a ring shaped step (22), on which the hollow reflector base lies, in a pushed-in position. The opening of the hollow reflector (17) is a size equal to the casing contour of the LED (16). The inner reflector surface (18,19,20), at the ring shaped edge formed by the opening, ends in the longitudinal axial direction behind or under the LED radiation point. This is beaker shaped and preferably has a conically shaped casing part extending to the open end.
