Abstract (en)

[origin: WO9962679A1] In a method for dividing a log two first cuts (4) are applied in the longitudinal direction of the log for removing surface-near material along two planes extending in the transversal direction of the log substantially in parallel with each other for forming first cut surfaces (4). Furthermore, at least one second cut (5, 6) is applied on the log in the longitudinal direction thereof between said planes and extending in the transversal direction of the log substantially in parallel with the planes. At least a third cut (17, 18) is applied substantially perpendicularly to said planes while intersecting the first cut surfaces (4) so that sub-surfaces (19, 20) thereof results on each side of the third cut, so that at least four first wood pieces (21) having one said sub-surface (19) each are formed.
