Abstract (en)

[origin: FR2783605A1] An electrical signal is obtained from a biological and/or chemical sample, characteristic of its activity or active elements. The signal is treated to produce a specific excitation field, which can be applied to a sample remote from the first. Independent claims are included for a system and device for carrying out the process. Electrical signals are obtained from a sample (1) contained in a glass cell (3) adjacent to an electrical, magnetic or electromagnetic signal emitter (4). After passing through the sample the transformed signal is received by a transducer (6), and relayed (9') to a computer.
