Abstract (en)
[origin: WO0023999A2] The invention relates to a receptacle for storing and protecting disk-shaped objects, especially disk-shaped data carriers such as diskettes, compact discs (CDs), removable hard disks, records, optical filter disks, lenses, holograms or semiconductor disks, comprising a flat, substantially cuboid, receiving jacket that is provided with a recess in order to receive a disk-shaped object at least partially, and a substantially cylindrical segment-shaped sealing jacket that is rotationally connected to the receiving jacket, whereby the axis of rotation is located approximately on the symmetrical plane of the sealing jacket which contains a cylindrical axis. The axis of rotation is arranged in such a way that it can be displaced inside a groove which is perpendicular to the axis of rotation in the receiving part.
