Abstract (en)

[origin: DE19843626A1] A terminal address (EA-A, EA-B) and an exchange address (AA1, AA2) designating the exchange (PBX1, PBX2) associated with a communication terminal (KE-A, KE-B) are stored in said communication terminal (KE-A, KE-B). When the communication terminal (KE-A, KE-B) is connected to a communication network (ATM-KN), a configuration message containing the address of the communication terminal (KE-A, KE-B) is sent to the exchange (PBX1, PBX2) which is determined by means of the exchange address (AA1, AA2), whereby said exchange is used to determine the network access address by means of the configuration message.
