Abstract (en)  
[origin: EP1116503A1] The racket comprises a frame connected to a handle (5) by a rod (4) which penetrates into the handle front end (51). The handle forms an internal displacement volume (53) for the rod. The handle front end is fitted with a resilient bearing (7) comprising a first socket shaped part arranged around the rod inside the internal volume. This bearing also has a second part arranged around the rod outside the handle. The external surface of this second part forms a transition surface between the rod external radial surface and the handle external surface.
