Abstract (en)

[origin: EP1118572A1] A device has two concentric cylinders rotatable about a vertical axis. Both cylinders are open at the top and closed at their bottom by a base plate. The first cylinder receives a first tube. The other cylinder has three discrete concentric area. The innermost and outermost of these areas can receive a second tube. The second tube can pass between these two areas via the third area. Preferred Features: The third area may have a ramp for guiding the second tube. The two cylinders may or may not be relatively rotatable. Both tubes are flexible. The second tube may be an offshore umbilical tube.
