Abstract (en)

[origin: EP1118743A2] The profile is at least partially filled with a sound-attenuating insulation material. The insulation material is made as a composite material having two different functional regions. The first functional region is an oscillation/sound-attenuating material while the other region serves to position the first region. At least one of the functional regions is designed as a sound-attenuating panel which can be inserted into the hollow chamber (H) of the profile.
