Abstract (en)  
[origin: WO0017472A1] The invention relates to a latch closure for walls, doors and shutters which are joined to frames, enclosures or the like by means of hinges. The frame, enclosure, door or wall surfaces which are joined to one another by hinges are essentially flush with one another when in a closed position. The inventive closure is comprised of a first closure housing (12) which can be fastened to the frame or the like and which has a rear-engaging element (14) for receiving the latch (16) of the latch closure (10) in a latching manner. The closure also comprises a second closure housing (18) which can be fastened to the door or the like. The latch (16) is arranged in said second closure housing such that it can be displaced against spring force by means of a handle (58). According to the invention, the second closure housing (18) forms a projection (40) that, when the door is closed, rests on a parallel front face (44) which is essentially parallel to the door plane (42) and which is formed by the first closure housing (12).
