Abstract (en)

[origin: WO0021317A1] A system and method for controlling a private branch exchange (PBX) from a remote user interface and a remote operator terminal is described. The requisite control over the processing unit of the PBX is established at a user interface which communicates to the processing unit using a wireless air interface. The requisite voice connection can either be co-located with the user interface or, alternatively, established at a cordless phone using a private wireless telephone system.
