Abstract (en)

[origin: EP1120550A2] The controller has an electromagnetic actuator with gas springs and an armature connected to a gas replacement valve and oscillating between magnets. Gas is fed from a reservoir via valves to the gas springs, which are separated by the armature, and is let out of the gas springs by outlet valves. The armature is a separating piston sliding in an actuator cylinder between the gas springs, which use a medium with larger molecules than air. The valve controller has an electromagnetic actuator (2) fitted with gas springs (3,4) and an armature (6) connected to a gas replacement valve (5) and oscillating between closing and opening magnets (7,8). Gas is fed from a rechargeable reservoir (9) via controlled valves (10) to the gas springs, which are separated by the armature, and gas is let out of the gas springs by controlled outlet valves (11). The armature is a separating piston (13) able to slide in an actuator cylinder (12) between the gas springs, which use a medium whose molecule size is greater than that of air.
