Abstract (en)

Using noise model storage section 302 for storing information on a noise model capable of expressing statistical characteristic quantities regarding an input noise signal with respect to statistical characteristic quantities for an input noise signal calculated by noise signal analysis section 301, noise model variation detection section 303 detects whether a noise model parameter indicating the input noise signal has changed or not, noise model updating section 304 updates the noise model and outputs the updated model information. Coding is performed on a non-speech segment speech segment (segment with only noise) of an input signal or on a noise signal separated from a speech signal using the noise signal coder in the above configuration, while coding is performed on a speech segment using a speech coder. <IMAGE>
