Abstract (en)
[origin: WO0017075A1] A conveyer in which, attached to the longitudinal connective structure with slack, such as a chain, there are successive transverse bar-like structures (2) with arranged widthwise across them a row of openings for containers or the like to be transported to different processing stations, the conveyer's line of movement running through these stations. Parallel to the conveyer's direction of motion, is fitted a positioning device (3), separate from the connective structure with slack, arranged to sequentially grip the bar (2) traveling from one station to another. Utilising the temporary coupling of members (8, 12) fitted onto the bar (2) and the positioning device (3), the positioning device (3) accurately positions the bar (2), at least longitudinally, in its correct place at the processing stations.
