Abstract (en)

[origin: FR2784763A1] The electronic component (Cl) has a microprocessor with an interruption port (7), a program memory (2), a working memory (3), a counter (4) and a random number generator (5). At the start of operations the random number generator produces a number (R) which loads the counter. When the counter reaches zero the microprocessor is interrupted and a secondary program of constant, variable or random length is run.
