Abstract (en)
[origin: EP1121961A1] The adjustment consists of a holder fixed to the snowboard, and a torsional piece for the binding's base plate. A toothed intermediate ring (15) engages with, and is disengaged from, counter-cogging on the base plate. The holder is in the form of a rail (1) fixed on the top of the snowboard and on which a stop-bolt (5) is locked in various lengthwise adjustable positions. A control (4), connected to an operating-disc (7), cooperates with a radial cam which is fixed in position on an intermediate plate (6).
