Abstract (en)

[origin: DE19944959A1] The paper winding roller has a surface layer (11) with orifices (15) which communicate with channels (16) in an intermediate layer (17). These lead to air take-up chambers (19) in a porous layer (12'). An final layer (18) which is impermeable to air is fitted inside the porous layer. An Independent claim is included for a method of making the roller.
