Abstract (en)

[origin: CA2356614A1] The invention relates to an injection apparatus comprising a housing (42) designed for receiving a container (50) containing a liquid. An axially sliding member (92) which is received in the housing (42) is used to act upon said container (50). An actuating member (174) is used to influence the position of the axially sliding member (92) relative to itself. An element (144) is placed in the housing (42) in such a way that it can slide axially but is substantially rotatively-blocked relative to the housing (42). The actuating member (174) can take at least two different positions relative to said element (144). In a first position (Fig. 12), it can rotate relative to said element (144) and in a second position (Fig. 13), it is rotatively blocked relative to said element (144). The invention also relates to a method for reconstituting an injection fluid and a method for performing an injection.
