Abstract (en)

[origin: US6523476B1] The invention aims at improving the quality of ammunition having a shell whose wall consists of a combustible or consumable wound body with at least one double layer of crossed threads. The wound body (1) forms a single piece. The winding density of the wound body (1) varies along the length of the wound body (1) so that distribution of the threads (3) optimally matches the charge of the shell (12).
