Abstract (en)

[origin: US2001013153A1] The present invention relates to an anchoring device for the covering 9 of a fabric broom on its associated support, which provides for extraction of the totality of the piece of fabric 9, including its extremities. This extraction, accomplished by means of a roller extractor, is made possible by providing anchor studs (14) having an underlying recess and extending from the upper surface of the support 1-3, through the use of articulated lever-shaped connecting grips 5 on support 1-3 comprising an arm that exerts pressure on appendages 15 of the piece of fabric 9 without interfering with the heads of anchor studs 14, and lateral shoulders 13 on support 1-3 configured in such a way that they define between them a determinate space from which neither anchor studs 14 nor connecting grips 5 emerge.
