Abstract (en)

[origin: WO0024660A1] According to the invention, the printed products (3) are delivered to a transfer position (4) by means of a delivery system (1) with a constant speed (v1) while forming an imbricated structure (S), in which the intervals (a1-a4) between successive printed products (3) are different. The section-by-section transfer of the printed products (3) is carried out at said transfer position by the gripping elements (12) of a removal device (2). These gripping elements (12) are arranged in a fixed interval (D) behind one another in a direction of delivery (B) of the removal device (2). Measures are now taken with which the printed products (3) are introduced into the jaws (15) of the gripping elements (12) at a constant speed (v1) and without altering the interval (a1-a4) between successive printed products (3). The printed products are introduced into said jaws so that each gripping element (12) transports away the number of printed products (3) delivered thereto with the same mutual interval (a', a'') as in the delivered imbricated structure formation (S). A deflection device (16) ensures that after a gripping element (12) receives a number of printed products (3), the subsequent printed products (3) are respectively introduced into the next gripping element (12) without altering the mutual interval (a1-a4) thereof.
