Abstract (en)

[origin: DE19849194A1] The on-board computer (11) is controlled by a position determination unit (14) to allow or inhibit a data link through a radio interface (18) with a home automation network (1). The setting up of the link is enabled when the distance between the network unit in the residence and the vehicle is reduced to a preset value. The computer of the vehicle mounted navigation apparatus is also used for controlling the vehicle functions. When the data link between the personal computer and the domestic unit is not established, a warning alarm signal is produced.
