Abstract (en)

[origin: EP1126115A2] The adjustable joint frame has a frame hinge part and casement/leaf part interlinked. An abutment part (1) is fixed to the casement/leaf, and an adjustment part (2) is movably guided in a horizontal direction in a direction at right angles to the articulated axis (10). The adjusting drive comprises a cam (3) which has a cylindrical part (11) rotarily held in a cavity (12) in the adjustment's cavity. An eccentric cylindrical pin fits into an elongated hole in the abutment. The cavity forms at least one pair of supports for the peripheral surface of the cylindrical part.
