Abstract (en)

[origin: EP1128407A2] The device has a time switch with manual setting of time of day and an operating time with a single-knob control with an outer first setting. The knob automatically returns to a second setting from a depressed third setting when released and remains there. When depressed to the third setting again and released the knob returns to the first setting and remains there. The knob is rotatable in the first setting and interacts with function switches. The device has a time switch enabling manual setting of time of day and an operating time with a single-knob control (6,8) that can be depressed from an outer first axial setting (8-1) through a lower second setting (8-2) to a depressed third setting (8-3) by a manual force. The knob automatically returns to the second setting when released and remains there. When depressed to the third setting again and released the knob returns to the first position and remains there. The knob is rotatable in the first position and interacts with switching elements (1F-35,18,20,22) for changing to setting functions for time of day or an operating time.
