Abstract (en)

[origin: WO0022973A1] A dishwashing machine that can control the flows in the washing lines independently, by means of different flap valve combinations, in order to regulate the fluctuations occurring in the pump pressure consequently in the flowrates as the result of variations in the washing water parameters due to such factors as the decomposition of dirt on the dishes to be washed, increase in temperature and use of chemicals; and that can also control and reduce the water and energy consumption by means of mechanical commands, pneumatic and electrical components and the operation programs selected by the user.
