Abstract (en)
[origin: WO0119319A1] The invention concerns a nipple (1) for a nursing bottle comprising a proximal portion P extended by a teat (2) and a distal portion D separated by a median portion M for administering a medicinal product together with an alimentary bolus. The nipple comprises a hollow sleeve (5) whereof one end is fixed to a bulge (3) at a point spaced away from the teat at the median portion and whereof the other end (6) is connected to means injecting (7) the medicinal liquid, to ensure that the medicinal product is mixed with the alimentary bolus contained in the nipple in its median portion. The sleeve (5) is integral with the median portion bulge and its end linked to the injection means (7) with a tapering profile for gradual insertion of said injection means. The invention is useful for medical treatment of children.
