Abstract (en)
[origin: WO0029079A1] A stick (10) such as a ski-stick, walking stick or same, provided with a handle (11) comprising a gripping element (19) and a length-adjustable pole (12) in addition to a regulating device (22) that contains a joint and is arranged outside the pole (12), whereby the gripping element (19) can be positioned at an angle to the pole and a tubular part (13) of the pole (12) can be pushed through the joint into the gripping element (19) of the pole when the regulating device is oriented in a rectilinear position. This ensures that the regulating device is substantially protected against the effects of the environment and the diameter of the pole is increased to a lesser degree. In order to achieve this, a regulating element (26) is respectively formed by the handle (11) on a lower extension piece (37) of the gripping element (19) and a cap (26) that is firmly connected to the upper end of the pole (12), whereby one respective regulating element (26) is pivotally and moveably accommodated in a recess (38) of the other regulating element (37).
