Abstract (en)

[origin: WO0030329A1] A data access system, including an interface for connecting to a caller using a voice call path, a call flow module for receiving a request for data from the caller on the call path, and a page translator for sending the request to a location in a communications network determined by the request, the location including the data in a prompt navigation language. The page translator receives and translates the data in the prompt navigation language into voice data, and the call flow module, with a text to speech converter, converts the voice data to voice for the caller on the call path. The system provides a voice browser for standard telephone users to access data on communications networks, such as the Internet.
