Abstract (en)
[origin: EP1132027A1] The padded back part (20,25.1) is swivel mounted to the top of a vertical carrying element (25), which is accommodated with its lower end in a box shaped, slightly pointed holding device (21). The carrying element (25) can be vertically moved in order to adjust the height of the back part (20) and is kept in place by a transversally arranged bow (27,27.1) operated with a button (27.2) protruding from the side of the holding device (21), which engages with a serrated profile (26), positioned inside the lower area of the carrying element (25). The holding device (21) can be swiveled around an horizontal axle (30.1) at the upper seat carrying shell (11) in order to facilitate a back and forward motion of the back part (20).
