Abstract (en)

[origin: EP1132527A2] Cover comprises a frame having at least two frame parts (1, 2, 3, 4) supporting at least one lid. The frame parts each have a longitudinal support (11, 21, 31, 41) having two support ends on which devices (12, 13, 22, 23, 32, 33, 42, 43) are arranged for a socket connection with another frame part. The lid and the frame parts with the socket connection devices are designed so that the socket connection devices on one support end connect with a counterpiece on another frame part in such a way that after all the pieces have been stuck together the two frame parts can no longer be simply pulled apart. Independent claims are also included for a frame part and a use of the cover.
