Abstract (en)

[origin: EP1134181A2] The present device is provided with conceptually new means which allow an angular displacement of the fork-carrying or tool-carrying plate, which means are very advantageous in comparison with the known solutions as the conventional system of rotation on ball bearings is no more necessary. In general, such means comprise a device of rotation (1) which is obtained in a fixed element or casing (2) on the rear side of which there are fixing clamps (2') which are to be coupled with corresponding front clamps (3) which are fixed to the self-moving lift truck. The fixed element or casing (2) is provided with a hollow seat in which a crown (4) is inserted. The crown (4) represents the rotating part on which an outer fork-carrying unit is mounted. A supporting plate (5) is included in the fork-carrying unit. <IMAGE>
