Abstract (en)

[origin: WO0033600A1] A system, method, and apparatus for routing an incoming call to a roaming mobile station are presented. An incoming call terminating at a roaming mobile station is received at a redirecting node. The redirecting node then determines the location of the mobile switching center serving the mobile station. After determining the location of the mobile station, the redirecting node routes the call to the serving mobile switching center, thereby bypassing unnecessary trunk connections from the redirecting node to the network to which the mobile station subscribes, and from the network to which the mobile station subscribes to the serving mobile switching center.
