Abstract (en)

A protection circuit for protecting a photocathode of an image intensifier tube from being overdriven during operation includes a high voltage power supply for supplying the photocathode with a photocathode potential, a measurement circuit for measuring the current supplied to the photocathode, and a logic circuit for interrupting the photocathode potential supplied to the photocathode when the measured current indicates that the photocathode is being overdriven. More specifically, the measurement circuit includes a resistance connected between the high voltage power supply and the photocathode of the intensifier tube; and a sensing circuit for sensing a voltage across the resistance. In another feature, the measurement circuit and the logic circuit are configured to float with respect to ground. <IMAGE>
