Abstract (en)

[origin: CA2355665A1] Known devices for placing aortic endoprostheses comprise a guide wire by means of which the opening of the main prosthesis already positioned in the aneurysm is sounded prior to insertion of the extension. This is a long and risky procedure. According to the device provided for in the invention a second guide wire for the extension is fixed to the first guide wire used for the main prosthesis in such a way that said second wire can be aligned with the first. In this way the opening for receiving the extension can be sounded from the interior both rapidly and safely.
