Abstract (en)
[origin: US6676315B1] In a device for printing and delivering semi-rigid tag-type labels (5) to packaging and sealing machines a feed means has a finger (13) translationally moved to and fro, which during the working stroke grasps behind a shoulder of the respective label and advances the same by a defined distance, whereas during the return stroke it glides over the succeeding label until at the end of the return stroke it grasps behind the shoulder of this succeeding label. During the return stroke a printing and embossing roller (15) lifted off during the working stroke is urged against the succeeding label, and the same is inscribed. This ensures that every single tag-type label is correctly printed and delivered for attachment to the object to be labelled.
