Abstract (en)
[origin: WO0041064A1] Method and apparatus for network delivery and remote printing of documents. An e-mail message including a destination identifier is sent on a network to a remote print service (RPS) provider. The RPS provider receives the message and determines, from the destination identifier, a destination printer address and print format capabilities for a corresponding destination printer local to the intended recipient of the e-mail message. The RPS provider modifies the e-mail message to conform, as necessary, to the print format capability of the destination printer and sends the modified e-mail message on the network to the destination printer. The destination printer receives and prints the modified e-mail message.
