Abstract (en)

[origin: WO0042277A1] The invention relates to a clip for securing mesh to a post with a protuberance extending over its length. The clip comprises a roughly U-shaped profile part (2), the legs of which are provided with recesses (4) that can grip around the protuberance. The clip further comprises end flanges (7) on arms (6) that extend from the U-shaped profile part (2) and a central flange (12), such that between the central flange (12) and the end flanges (7) a space remains into which a vertical rod can be introduced near the side border of a mesh, while a part of a horizontal rod rests against the top of the uppermost arm of a clip or against the underside of the lowermost arm of a clip. The possibility of stretching the mesh material is achieved by utilizing two clips on a post in this manner. In a preferred embodiment parts of the central flange (12) and end flanges (7) are replaced by four protrusions (14).
