Abstract (en)

[origin: WO0113225A2] The invention concerns a method for asynchronous data transmission between a provider and a consumer, in accordance with ACID characteristics, the supplier and the consumer being connected by a communication channel chain. Said method is characterised in that the data are transmitted through independent transactions established: between the supplier and a first communication channel of the chain; between each of the communication channels of the chain; and between the last communication channel of the chain and the consumer.
