Abstract (en)
[origin: FR2783390A1] The mobile telephone access network has a switching point for an exterior network (VCX) and a switching point for local network access (RLA). Connection is made via radio links (BR) from a mobile terminal (MT). When a virtual path is determined, user cells are transported in the local channel, and whilst the mobile unit is within the network a channel is formed between the terminal and the exterior network switching point. The switching point provides an associated identifier.
