Abstract (en)

[origin: EP1146001A2] There are shoulders at the end of the entrance channel (13), defining recesses (11) which accommodate the upstream ends of the points blades (2,3). The hinge points (14) for the blades are just upstream of the fixed separation points (9,10) between the center and the side channels. When the paper goes into the center channel (7), the two points blades lie in the recesses on either side of the entrance channel. When the paper goes in the right-hand channel (6) the right-hand blade is swung over so that its tip is in contact with the left hand blade. To divert the paper into the left-hand channel (8), the left point blade is swung over to the right.
