Abstract (en)
[origin: EP1146195A1] The shutter has a series of parallel slats (L) pivoted to lateral uprights and connected by links (a) to a control rod (b). The angular position of the slats is set by a control lever with a support plate (1) and a bar (5) pivoted to the lower end of the control rod. The bar has a toothed sector (6) on one end engaging with at least one tooth on a locking lever (4) attached to the control lever so that the slats can be locked at the required angle.
