Abstract (en)

[origin: WO0032097A1] This invention is a client server computer communication system (100) with feedback to dispense medicine, so that medical personnel can receive feedback from the patient regarding the medical regimen. A medicine dispenser (109) is coupled to a client device (110). The patient enters information in the client device (110) about following the medical regimen. Medical personnel can receive that information at a medical professional device (150), and possibly alter the behavior of the client device (110) or the medicine dispenser (109). The medical personnel monitor compliance, effectiveness of the prescribed medical regimen, present regimen reminders for the patient, and alter the medical regimen in response to feedback from the patient. The client device (110) communicates with the server device (160) to receive information regarding when the patient should take the prescribed medicine. The medicine dispenser (109) dispenses only the dosage of medicine directed by the prescribed medical regimen, and records information from the patient regarding compliance.
