Abstract (en)

[origin: US6732494B1] An envelope consisting of a front side and a rear side which are interconnected by side flaps, has a fold-back flap to which a layer of contact adhesive is applied. The adhesive used is a strong contact adhesive which is effective without moistening or activation by any other means. The fold-back flap is laid against the rear side of the envelope for the purposes of transport and storage, an area coated with a parting agent being provided so that the adhesive can be detached before use. The envelope is closed by pressing the otherwise uncoated closing flap onto the adhesive-coated fold-back flap. The adhesive is applied to the fold-back flap by transfer, i.e. the adhesive is applied to the parting agent layer during production and then transferred to the fold-back flap when the latter is redressed.
