Abstract (en)  
[origin: WO0040823A1] A retaining element for a building sheet has an elongate head (1) for engaging the building sheet, a mounting element (3) spaced from the head, and a connecting member (2) connecting the head and the mounting element (3) in a fixed relation. The retaining element further has a support element (4) which detachably receives and holds the mounting element (3). The support element (4) and the mounting element (3) are relatively rotatable between a first position at which the mounting element is freely detachable and a second position in which the mounting element is held firmly on the support element by a clamping action. The support element (4) is elongate and has a recess to receive the mounting element (3), bounded by opposed overhanging flanges forming, with the base of the recess, slots which receive and clamp edge portions of the mounting element in the second position.
