Abstract (en)
[origin: EP1148301A1] The burner-boiler system comprises several elements through which water flows. The modular structure enables the number and sequence of the elements (11-17) used in the system to be freely set. Each element consists of a first number of internal pipes (23) for a warm water circuit and or a second number of internal pipes (24) for a heating water circuit. Connecting points (25-33) are positioned between the internal pipes and or between the internal pipes and connecting pipes (18-22) for the warm water and or heating water circuits.
