Abstract (en)

[origin: DE19904716A1] The invention relates to a device (40) for selectively regulating the temperature of at least one container (3) of an aggregate (30) which represents a plurality of such containers (3). Said device comprises a receiving plate (1) for the container aggregate (30) which serves to maintain the container aggregate (30) at a predetermined temperature. The receiving plate (1) is provided with at least one opening through which one temperature-regulating element (2) is contacted with a container (3) whose temperature is to be regulated for the purpose of heat exchange. The container aggregate (30) and the one temperature-regulating element (2) can be moved relative towards one another. At least one additional cooling zone can be provided which dissipates the heat given off by the temperature-regulating element (2) that has not been used to regulate the temperature of the container (3).
