Abstract (en)

[origin: EP1149605A1] Producing a protective respiration filter, involves mixing of adsorptive, absorptive, chemisorptive or catalytic materials, in particular, activated carbon, with one or more meltable polymers and heating of this mixture under pressure. The heating process takes place in a connector element of an individual respiration filter or a fan filter, or in a connector element of adapters of such filters, and results in an airtight joint being formed between the pressed filter material and its container. An Independent claim is also included for an apparatus for implementation of the proposed method.
