Abstract (en)

[origin: EP1149648A1] Process for thermally controlling the copper plate facing the steel in a continuous casting mold comprises maintaining a selected mold cooling water temperature on the mold outlet independent of the casting speed; measuring and regulating the mold outlet temperature using a tubing between the outlet and the inlet; mixing hot mold run-off water with cooled mold run-off water; and driving the water through the mold to maintain a constant temperature. An Independent claim is also included for a device for thermally controlling the copper plate facing the steel in a continuous casting mold. Preferred Features: An oscillating mold is used. The casting speed is up to 15 m/min..
