Abstract (en)
[origin: EP1149666A2] The pliers type combination tool has two legs (2,3) pivotable relatively to each other around an articulation axis (6). As extensions to the axis are two mandrels (15,16), one at each end, for calibrating and bevelling pipe ends. The mandrels are formed for processing different pipe diameters. The two mandrels are connected to each other, thus forming the articulated axis. The connection between them is an axially extending screw (19). At least one of them has peripheral bevelling cutters (26,27) formed by radial recesses (25), each recess forming a front and a rear cutter. Viewed in an axial direction, in front of the bevelling cutters is an all-round swarf groove (22).
