Abstract (en)  
[origin: EP1150184A1] Watch movement enables a rotating cylinder to be seen through the face of the watch. A cylinder makes a twelfth of a rotation in an hour, while a rotating plate rotates once per hour. Watch movement comprises a cylinder that drives a rotating plate via a gear wheel. A bridge is mounted on the plate and its index indicates minutes. A first part of the gear wheel comprises a planet gear that rotates between the drum of the cylinder and a bridge including an hour indicator. The planet gear rotates around a fixed coil and drives a fixed pinion on the rotating plate. A second part of the gear wheel drives an escape and a regulator.
